# SDS Manager

SDS Manager is a powerful tool that allows you to manage your product data efficiently. It provides a user-friendly interface for uploading, matching, and validating data from various sources. The system is designed to streamline your workflow and ensure data accuracy.

Once you have uploaded your product list, the next step is to match the columns. This process involves identifying the correct headers for your data and mapping them to the system's fields. The interface guides you through this process, ensuring that all necessary information is captured.

After matching the columns, you can proceed to validate the data. The system will check for any errors or inconsistencies in your upload.
